

# SNS COLLEGE OF TECHNOLOGY

AN AUTONOMOUS INSTITUTION

COIMBATORE 35

DEPARTMENT OF ELECTRONICS AND COMMUNICATION ENGINEERING

## \* Machine Learning Process:

Gathering data

Data preparation  $\left\{ \begin{array}{l} \text{Data exploration} \\ \text{Data preprocessing} \end{array} \right.$

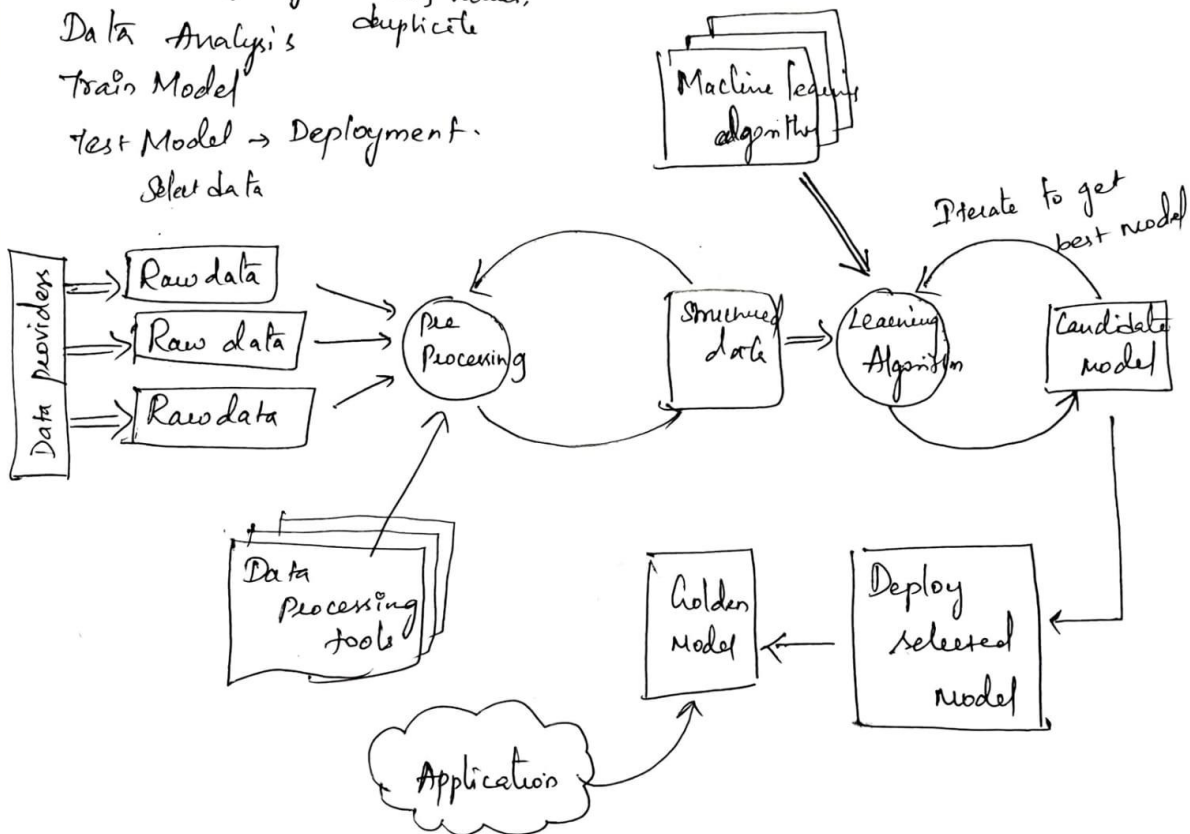

Data wrangling  $\left\{ \begin{array}{l} \text{Missing values,} \\ \text{duplicate} \end{array} \right.$

Data Analysis

Train Model

Test Model  $\rightarrow$  Deployment

Select data

## WEIGHTS and BIASES:

→ Commonly referred as  $w$  and  $b$ , are the learnable parameters of some machine learning models including neural n/w's.

→ Neurons are basic units of neural n/w.

→ In ANN, each neuron in a layer is connected to some or all of the neurons in next layer.

→ When the i/p are transmitted b/w neurons, the weights are applied to the i/p along with the bias.

$$Y = \sum (\text{weight} * \text{input}) + \text{bias}$$

⇒ Weights control the signal b/w two neurons. Weights decide how much influence the i/p will have on the o/p.

⇒ Biases which are constant, are an additional i/p into the next layer that will always have the value of 1.

⇒ Bias units are not influenced by the previous layer (no incoming connections) but they do have outgoing connections with their own weights.

→ The bias unit guarantees that even when all the i/p are zeros there will still be an activation in the neuron.

weight  $\rightarrow$  strength of the connection. ③

eg: dog & cat identification
