

UNIT II

ARITHMETIC OPERATIONS

Addition and subtraction of signed numbers – Design of fast adders – Multiplication of positive numbers - Signed operand multiplication- fast multiplication – **Integer division** – Floating point numbers and operations

Recap the previous Class

Introduction

- Division is more complex than multiplication.
- Example: Typical values in Pentium-3 processor.
 - Not easy to construct high-speed dividers.
- The ratios have not changed much in later processors.

Instruction	Latency	Cycles / Issue
Load / Store	3	1
Integer Multiply	4	1
Integer Divide	36	36
Floating-point Add	3	1
Floating-point Multiply	5	2
Floating-point Divide	38	38

The Process of Integer Division

- In integer division, a *divisor* M and a *dividend* D are given.
- The objective is to find a third number Q , called the *quotient*,
such that $D = Q \times M + R$ where R is the *remainder* such that $0 \leq R < M$.
- The relationship $D = Q \times M$ suggests that there is a close correspondence between division and multiplication.
 - Dividend, quotient and divisor correspond to product, multiplicand and multiplier, respectively.

- One of the simplest division methods is the **sequential digit-by-digit algorithm** similar to that used in pencil-and-paper methods.

<div style="border: 1px solid black; padding: 5px; width: fit-content;"> <p>$D = 37 = (100101)_2$ $M = 6 = (110)_2$ Quotient $Q = 6$ Remainder $R = 1$</p> </div>	<div style="display: flex; align-items: center;"> <div style="margin-right: 10px;">Divisor M</div> <div style="border-left: 1px solid black; border-bottom: 1px solid black; padding-left: 10px;"> $110 \overline{) 100101}$ $\underline{110}$ 100101 $\underline{110}$ 01101 $\underline{110}$ 0001 $\underline{110}$ 001 </div> </div>	<p>Quotient $Q = Q_0Q_1Q_2Q_3$ Dividend $D = R_0$ $Q_0 \cdot M$ (Does not go; $Q_0 = 0$) R_1 $Q_1 \cdot 2^{-1} \cdot M$ (Does go; $Q_1 = 1$) R_2 $Q_2 \cdot 2^{-2} \cdot M$ (Does go; $Q_2 = 1$) R_3 $Q_3 \cdot 2^{-3} \cdot M$ (Does not go; $Q_3 = 0$) $R_4 = \text{Remainder } R$</p>
----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

- Machine implementation:

- For hardware implementation, it is more convenient to shift the partial remainder to the left relative to a fixed divisor; thus

$$R_{i+1} = 2R_i - Q_i \cdot M \quad (\text{instead of } R_{i+1} = R_i - Q_i \cdot 2^{-i} \cdot M)$$

- The final partial remainder is the required remainder shifted to the left, so that $R = 2^{-3} \cdot R_4$

Machine implementation

Divisor M	1 1 0	1 0 0 1 0 1	Dividend = $2R_0$	Quotient Q
		1 1 0	$Q_0 \cdot M$	0
Do not subtract		-----		
		1 0 0 1 0 1	R_1	
		1 0 0 1 0 1 0	$2R_1$	
		1 1 0	$Q_1 \cdot M$	0 1

		0 1 1 0 1 0	R_2	
		0 1 1 0 1 0 0	$2R_2$	
		1 1 0	$Q_2 \cdot M$	0 1 1

		0 0 0 1 0 0	R_3	
		0 0 0 1 0 0 0	$2R_3$	
		1 1 0	$Q_3 \cdot M$	0 1 1 0

		0 0 1 0 0 0	$R_4 = 2^3 \cdot R$	

$D = 37 = (100101)_2$
 $M = 6 = (110)_2$
 Quotient $Q = 6$
 Remainder $R = 1$

Restoring Division: The Data Path

Basic Steps

Repeat the following steps n times:

- a) Shift the dividend one bit at a time starting into register A.
- b) Subtract the divisor M from this register A (*trial subtraction*).
- c) If the result is negative (*i.e. not going*):
 - Add the divisor M back into the register A (*i.e. restoring back*).
 - Record 0 as the next quotient bit.
- d) If the result is positive:
 - Do not restore the intermediate result.
 - Record 1 as the next quotient bit.

sns

START

A = 0; M = divisor;
Q = dividend; COUNT = n

Shift left A, Q

A = A - M

Trial subtraction

A -ve ?

No

Yes

$Q_0 = 1$

$Q_0 = 0$
 $A = A + M$

Restoration

COUNT = COUNT - 1

COUNT = 0?

No

Yes

STOP

Restoring Division

- Quotient in Q
- Remainder in A

A

Q

M

A Simple Example: 8/3 for 4-bit representation (n=4)

Initially:	0 0 0 0 0	1 0 0 0
	0 0 0 1 1	
Shift:	<u>0 0 0 0 1</u>	0 0 0 -
Subtract:		
Set Q_0 :	<u>1</u> 1 1 1 0	
Restore:	<u>0 0 0 1 1</u>	
	0 0 0 0 1	0 0 0 <u>0</u>
Shift:	0 0 0 1 0	0 0 0 -
Subtract:		
Set Q_0 :	<u>1</u> 1 1 1 1	
Restore:	<u>0 0 0 1 1</u>	
	0 0 0 1 0	0 0 0 <u>0</u>

Shift:	0 0 1 0 0	0 0 0 -
Subtract:		
Set Q_0 :	<u>0</u> 0 0 0 1	
	0 0 0 0 0	0 0 0 <u>1</u>
Shift:	0 0 0 1 0	0 0 1 -
Subtract:		
Set Q_0 :	<u>1</u> 1 1 1 1	
Restore:	<u>0 0 0 1 1</u>	
	0 0 0 1 0	0 0 1 <u>0</u>

Remainder
00010 = 2

Quotient
0010 = 2

Perform the restoring division algorithm for the number $11_{10} / 3_{10}$

$11/3$
 $n = 4$ B_n
 Dividend = 1010 \oplus
 Divisor = 0011 $M = 00011$
 $2^5 M = 11101$

	A	Q bit	
Initial Value	00000	1010	} Cycle 1.
Shift left Aq	00001 ✓	010 □	
A = A - M	$\begin{array}{r} 11101 \\ 11110 \\ \hline 00011 \end{array}$	010 \downarrow	
Set Q ₀ = 0 \otimes	\otimes 00001 ✓	010 \downarrow	
A = A + M			
Shift left Aq	00010	100 □	} Cycle 2.
A = A - M	$\begin{array}{r} 11101 \\ 11111 \\ \hline 00011 \end{array}$	100 \downarrow	
Set Q ₀ = 0 \otimes	\otimes 00010	100 \downarrow	
A = A + M			
Shift left Aq	00101	000 □	} Cycle 3.
A = A - M \otimes	\otimes 00010	000 \downarrow	
Set Q ₀ = 1	00010	000 \downarrow 1	
Shift left Aq	00100	001 □	} Cycle 4.
A = A - M \otimes	\otimes 00001	001 \downarrow	
Set Q ₀ = 1	00001	001 \downarrow 1	
	Remainder	Quotient	

Example : $7_{10} / 3_{10}$

A	Q	M = 0011	
0000	0111		Initial Value
0000	1110	Shift	} First cycle
1101		Subtract	
0000	1110	Restore	
0001	1100	Shift	} Second cycle
1110		Subtract	
0001	1100	Restore	
0011	1000	Shift	} Third cycle
0000		Subtract	
0000	1001	Set $Q_0 = 1$	
0001	0010	Shift	} Fourth cycle
1110		Subtract	
0001	0010	Restore	
Remainder 0001	Quotient 0010		

Non-Restoring Division

- The performance of restoring division algorithm can be improved by exploiting the following observation.
- In restoring division, what we do actually is:
 - If A is positive, we shift it left and subtract M. That is, we compute $2A - M$.
 - If A is negative, we restore it by doing $A + M$, shift it left, and then subtract M.
 - That is, we compute $2(A + M) - M = 2A + M$.
- We can accordingly modify the basic division algorithm by eliminating the restoring step ☐ ***NON-RESTORING DIVISION***.

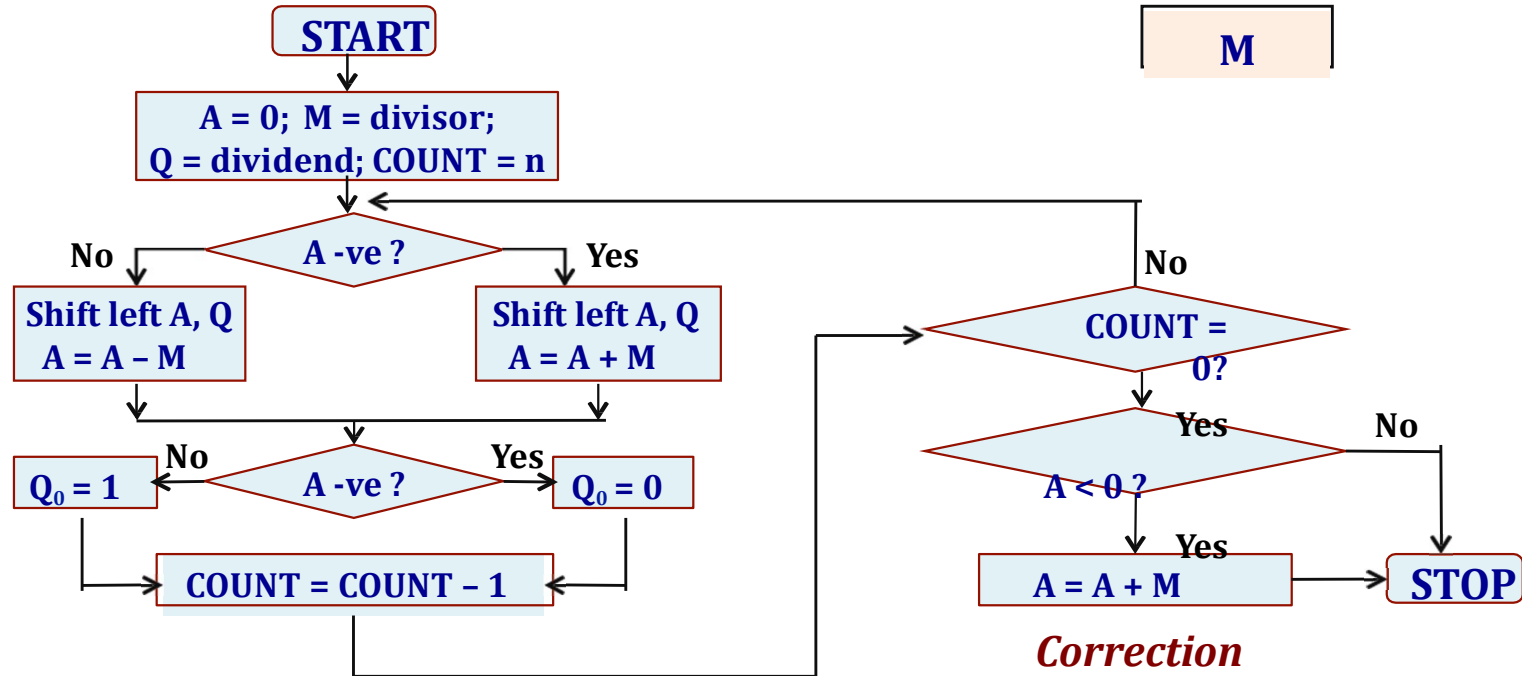

Shift left means multiplying by 2.

Basic steps in non-restoring division:

- a) Start by initializing register A to 0, and repeat steps (b)-(d) n times.
- b) If the value in register A is positive,
 - Shift A and Q left by one bit position.
 - Subtract M from A.
- c) If the value in register A is negative,
 - Shift A and Q left by one bit position.
 - Add M to A.
- c) If A is positive, set $Q_0 = 1$; else, set $Q_0 = 0$.
- d) If A is negative, add M to A as a final corrective step.

Non-Restoring Division

A Simple Example: 8/3 for n=4

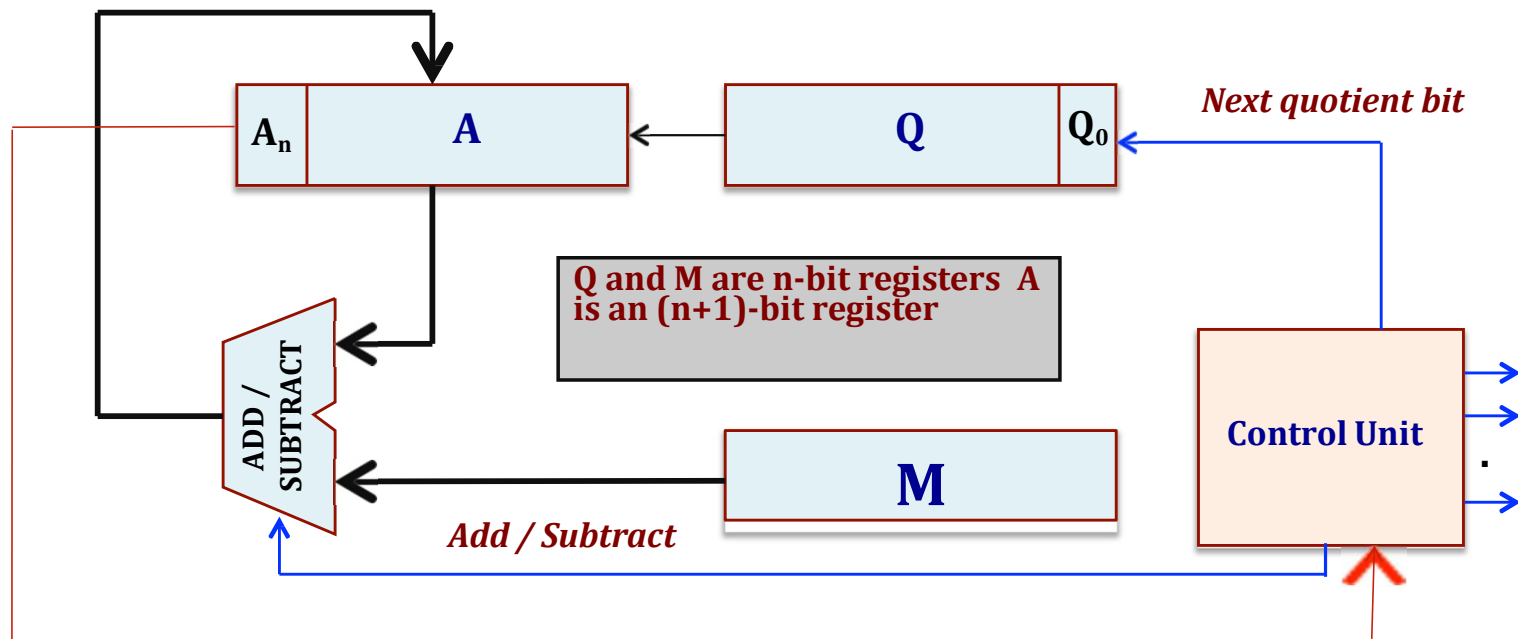

Initially:	0 0 0 0 0	1 0 0 0
Shift:	0 0 0 0 1	0 0 0 -
Subtract:	- 0 0 1 1	
Set Q_0 :	1 1 1 1 0	0 0 0 0
Shift:	1 1 1 0 0	0 0 0 -
Add:	0 0 1 1	
Set Q_0 :	1 1 1 1 1	0 0 0 0
Shift:	1 1 1 1 0	0 0 0 -
Add:	0 0 1 1	
Set Q_0 :	0 0 0 0 1	0 0 0 1

Shift:	0 0 0 1 0	0 0 1 -
Subtract:	- 0 0 1 1	
Set Q_0 :	1 1 1 1 1	0 0 1 0
Correction Add:		
	1 1 1 1 1	
	0 0 0 1 1	
	0 0 0 1 0	

Quotient
0010 = 2

Remainder
00010 = 2

Data Path for Non-Restoring Division
