Atom:

Let $(B, \wedge, \vee, 0, 1)$ be a BA.

A non zero elt. $a \in B$ is called an atom if it is an immediate successor of zero elt.

ie., $0 \leq b \leq a \Rightarrow b = 0$ or $b = a$.

Stone's Theorem:

Let B be a finite BA and A be set of all atoms of B. The B.A B is isomorphic to the BA $P(A)$, where $P(A)$ is the power set of A.

Corollary:

Every finite B.A. $(B, \wedge, \vee, 0, 1)$ has 2^n elts. for some +ve integer n.

sub boolean Algebra

Let $(B, \wedge, \vee, -, 0, 1)$ be a boolean algebra and $S \subseteq B$. If S contains the elements 0 and 1 and it is closed under the operations $\wedge, \vee$ and $-$, then $(S, \wedge, \vee, -, 0, 1)$ is called sub boolean algebra.

prove that D_{110}, the set of all +ve divisors of +ve integer 110, is a boolean algebra and find all sub algebras.

Sol:

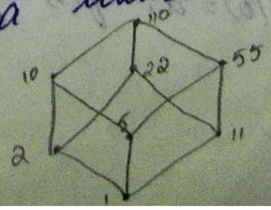
$$D_{110} = \{1, 2, 5, 10, 11, 22, 55, 110\}$$

since D satisfies reflexive, antisymmetric, Transitive property, D is the partial order relation on D_{110} (D_{110}, D) it is a poset.

Here $a \wedge b = GLB(a, b)$ $\forall a, b \in$

$a \vee b = LUB(a, b)$

$(D_{110}, \wedge, \vee)$ is a lattice. Its hasse diagram is



Here least element (0 element) is 1

$LCM(1,110) = 110$
$GCD(1,110) = 1$

Greatest element (1 element) is 110

$1' = 110$
$2' = 55$ $11' = 10$
$5' = 22$

Here each and every element has a complement

$\therefore$ It is complemented lattice.

from the hasse diagram It is clear that,
